

## HeadAMP Audio Amplifier

### Four Output Stereo Headphone Amplifier

The HeadAMP has been designed to provide high quality, perfect audio amplification for use in the demanding environments of the museum, heritage and attractions industries. This compact audio amplifier can control, individually, the volume control for up to four stereo headsets at any one time. The HeadAMP can be driven by either line-level or headphone amplifier signals, either mono or stereo.

#### Product Summary:

- Four separate output channels, each with it's own volume control settings
- Stereo 1/4" input jack can be connected to any line-level or headphone amplifier output
- Four stereo 1/4" headphone outputs
- Power on LED indicator
- Maximum Input Level: +14dBV
- Maximum Output Level: 20dB per channel
- Power Supply: 12V DC

This device can also be used for home recordings. If a home recording involved from one to four people, any or all of them could need headphone monitoring. The monitor amp would be connected to the tape deck's headphone output or a mixer output so that the performers can hear themselves and each other. The same application can apply to band rehearsals and even home entertainment systems!
